

# Package ‘quadsum815’

January 24, 2019

**Type** Package

**Title** Various R and Rcpp Implementations of a Quadratic Sum

**Version** 1.0

**Author** Stephen Salerno

**Maintainer** Stephen Salerno <salernos@umich.edu>

**Description** This package is in fulfillment of the requirements of Homework 00 for BIO-STAT 815. quadsum815 provides five different implementations of functions to compute a single scalar value of the quadratic sum  $x' Ay$ . The functions are as follows: (1) quadsumR: A loop-based R implementation, (2) quadsumS: A loop-free R implementation, (3) quadsumT: A matrix-based R implementation, (4) quadsumC: A loop-based Rcpp implementation, and (5) quadsumB: A blockwise loop-based Rcpp implementation.

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**Imports** Rcpp (>= 0.12.18)

**LinkingTo** Rcpp

**RoxygenNote** 6.1.0

**NeedsCompilation** yes

**Archs** i386, x64

## R topics documented:

---

quadsumB	<i>A blockwise loop-based Rcpp implementation for computing <math>x' Ay</math></i>
----------	--

---

**Description**

This function computes  $x' Ay$  using blockwise nested loop using Rcpp

**Usage**

```
quadsumB(x, y, A, blkSize)
```

**Arguments**

x	A size $n$ vector
y	A size $m$ vector
A	A size $(n \times m)$ matrix
blkSize	The size of blocks (in #rows or #cols) in calculating $x' Ay$

**Value**

A scalar value evaluating  $x' Ay$

**Examples**

```
quadsumB(rep(1,100),rep(1,100),matrix(1,100,100), 100) # [1] 10000
```

---

quadsumC	<i>A loop-based Rcpp implementation for computing <math>x' Ay</math></i>
----------	--

---

**Description**

A loop-based Rcpp implementation for computing  $x' Ay$

**Usage**

```
quadsumC(x, y, A)
```

**Arguments**

x	A size $n$ vector
y	A size $m$ vector
A	A size $(n \times m)$ matrix

**Value**

A scalar value evaluating  $x' Ay$

**Examples**

```
quadsumC(rep(1,100),rep(1,100),matrix(1,100,100)) # [1] 10000
```

quadsumR

*A loop-based R implementation for computing  $x' Ay$* **Description**A loop-based R implementation for computing  $x' Ay$ **Usage**

quadsumR(x, y, A)

**Arguments**

x                    A size  $n$  vector  
y                    A size  $m$  vector  
A                    A size  $(n \times m)$  matrix

**Value**A scalar value evaluating  $x' Ay$ **Examples**

```
quadsumR(rep(1,100),rep(1,100),matrix(1,100,100)) # [1] 10000
```

quadsumS

*A loop-free R implementation for computing  $x' Ay$* **Description**A loop-free R implementation for computing  $x' Ay$ **Usage**

quadsumS(x, y, A)

**Arguments**

x                    A size  $n$  vector  
y                    A size  $m$  vector  
A                    A size  $(n \times m)$  matrix

**Value**A scalar value evaluating  $x' Ay$ **Examples**

```
quadsumS(rep(1,100),rep(1,100),matrix(1,100,100)) # [1] 10000
```

---

`quadsumT`*A matrix-based R implementation for computing  $x' Ay$* 

---

**Description**

A matrix-based R implementation for computing  $x' Ay$

**Usage**

```
quadsumT(x, y, A)
```

**Arguments**

<code>x</code>	A size $n$ vector
<code>y</code>	A size $m$ vector
<code>A</code>	A size $(n \times m)$ matrix

**Value**

A scalar value evaluating  $x' Ay$

**Examples**

```
quadsumT(rep(1,100),rep(1,100),matrix(1,100,100)) # [1] 10000
```
